Abstract of EP0596782

An elementary module for a signalling light comprises, in combination: - a framework (120), - at least one light-emitting diode (110) including a body (112), - at least one cover element (130) integral with the said framework. The latter comprises: - one opening (126) associated with each light-emitting diode for passage of the light emitted thereby, - means (125) for positioning one light-emitting diode opposite each opening, - means (132) for positioning the or each cover element opposite the openings, and - means for fastening the module onto a support element (200). Application to producing lights with shallow depth and having a homogeneous illumination field.
